PRIVATE WORKING SPACE

The building is situated at the harbour, in central Copenhagen. With its triangular form it stands as a sharp characteristic corner by the surrounding water. Aller multimedia building is a dynamic work place where the central atrium is used for multiple purposes such as talks, events and gatherings related to editorial activity. In the atrium the daylight enters and provides an optimal light source. The form of the atrium space opens up towards the sky and the harbour. This is done in such a way that the flooring structure recedes the higher up the floors are situated, which results in a terraced room with a vast inflow of light. The plan of the building is flexible and created so that the interior can change and be adapted according to different needs, over time. The overall design of the building inspired by the Nordicscape and materials. This is exemplified with the use of oak on the front edges of the balcony while the stairs and the walkways provide an airy and cool expression with their green and white colours in the glazed surfaces. There has also been a focus on creating a project that integrates the design of the workplace with an artistic dimension. The lamp installation "Tomorrow's Weather", which is elevated several floors in the central atrium marks this aspect. Beside its artistic function it has a particular function in that it changes colour according to the daily weather via direct contact with the Danish Meteorological Institute.

Green Hall PLH Arkitekter

The office building of Green Hall is developed as a business centre for the SBA group. It is situated near the Neris River in the City of Vilnius in Lithuania.

The 14 floor building has been inspired by forms found in nature and is shaped as an ellipse, which is covered by layers of glass that create a surface over the slightly curved and sloping geometry.

The ventilated double glass façade includes a sun-screen and the interior windows can be opened as a supplement to the ventilation system. This aspect contributes to a good indoor climate and reduced energy use.

The dynamic expression of the building and the homogeneous surface is created through the use of a bearing concrete construction, which is retracted from the façade. Secondary functions such as elevators, technical rooms, and toilets are situated in the central core of the building while working spaces, lounges, and meeting spaces are positioned in the external part of the building, which retains the most optimal daylight.

The entrance of the building is placed in the hall, which is characterised by double and triple room heights and by two floating organically formed meeting spaces. At the top of the building there are conference facilities with a view over the city of Vilnius.

The structure of the building is inspired by dna profiles.

Location	Vilnius, Lithuania
Client	SBA Group
